

Military Communications

3515A Military Portable Radio Communications Test Set

New Integrated Audio Connectors

The Aeroflex 3515A was developed for military use and offers rugged construction and testing in the 2 MHz to 1 GHz frequency range.

Featuring

- 2 MHz - 1 GHz operation
- AM/FM transmitter and receiver tests
- Over-the-air testing
- Antenna/cable tests

And now available in release 3.5.x

- Scripting Language Option
- PRM-34 Test Script
- Improved Antenna and Cable Test Operation

The Aeroflex 3515A is a Portable Radio Communications Test Set with the latest in portability, battery life and performance. The Aeroflex 3515A builds upon Aeroflex's expertise in developing portable radio test sets with exclusive features and affordability that are destined to set a new standard in portable radio test sets. The 3515A was developed for military use and is capable of measuring high power (20 W without an external attenuator, up to 150 W with an external attenuator provided), as well as finding faults in antennas, power amplifiers and interconnects. The 3515A meets the needs of a variety of vehicle radio tests, as well as commercial radio applications. With the additional capability to perform quick testing of antennas and cables, the 3515A provides the most complete in-vehicle test solution available to quickly isolate problems and assess performance of the radio, cable and antenna systems. The 3515A was designed to significantly reduce the number of radios incorrectly removed from vehicle where it was later determined to have no trouble found. With extensive operational capability, the 3515A provides portable test

features that are typically found in bench top radio test equipment.

Portable and Rugged

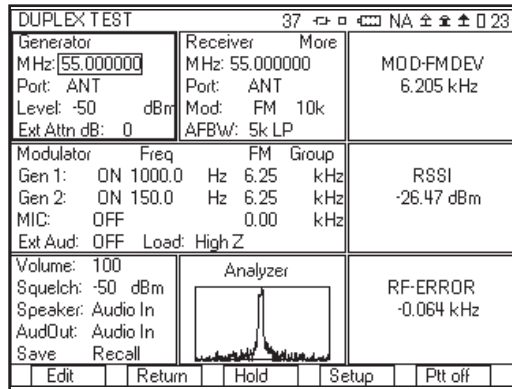

- Easy portability - weighs less than 8 lbs. (3.6 kg)
- Rugged construction - solid magnesium alloy weatherproof case
- -20° to +50° C operating temperature range
- 5 hour battery life

Aeroflex engineers designed the 3515A from the ground up to be portable and rugged, weighing in at less than 8 lbs (3.6 kg) including the battery. It has a solid magnesium alloy weatherproof case, an operating temperature range of -20° to +50°C, and rugged construction specifications (Mil-PRF-28800A) for humidity, altitude, shock, and vibration. The battery gives the user 5 hours of operation and can be fully re-charged and ready to operate in only 4 hours. In addition, the 3515A and the optional accessories can be stored in a ruggedized transport case.

Features and Functions

- Handset and antenna allow over the air "Talk Test"
- RSSI Meter
- RF Error Meter
- Modulation Measurements
- Audio Frequency Counter
- Spectrum Analyzer Option
- Audio Frequency Oscilloscope
- Scripting Language Option for Custom Applications

Designed to be used for quick installed radio testing, the 3515A can efficiently and easily find radio failures. There is no need to connect to the radio under test, simply connect the supplied antenna, key up the radio and then measure the radio parameters over-the-air. The provided handset can be used to check voice quality of the transmitter and receiver. A push-to-talk button on the handset controls whether the 3515A is transmitting or receiving. The Duplex test screen, shown below, is ideal for making quick transmitter and receiver measurements on an installed radio system.

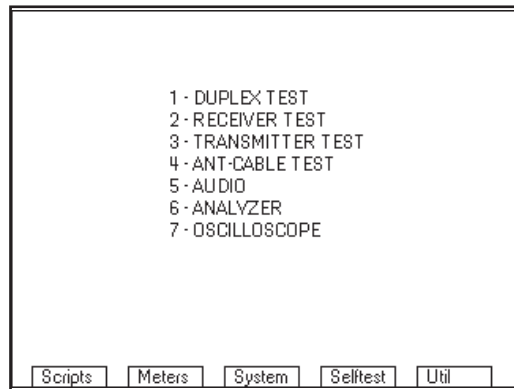

Duplex Test Screen

Bench Top Testing

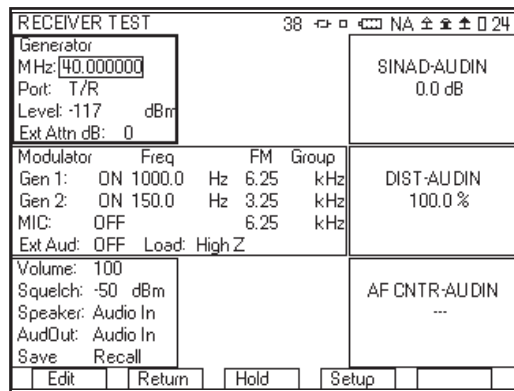

- RF power
- RF frequency error
- AM modulation/FM deviation
- Audio frequency counter
- Receive Signal Strength Indicator (RSSI)
- DCS encode/decode
- DTMF encode/decode
- Distortion meter
- SINAD/sensitivity
- Spectrum analyzer
- Audio frequency oscilloscope
- Frequency find
- Audio level meter

In addition to performing over the air measurements, the 3515A includes the capability to perform bench top type testing on a radio. All radio parameters including power, frequency error, modulation accuracy, receiver sensitivity and audio performance are easily accessed and tested with the 3515A.

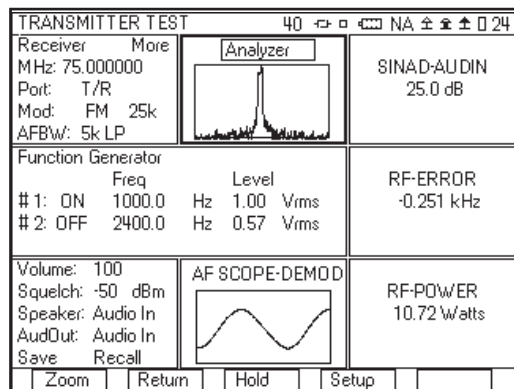

System Menu Screen

If the Receiver Test is selected, the 3515A operates as a signal generator, enabling the testing of the receiver portion of the radio. Audio SINAD, distortion, and frequency are among the tests that can be performed on the radio's receiver. With two internal generators that can be used as modulation sources, the 3515A can modulate the carrier with both a test tone and a squelch tone. Alternatively, the internal generators can generate both an audible test tone and squelch tone.

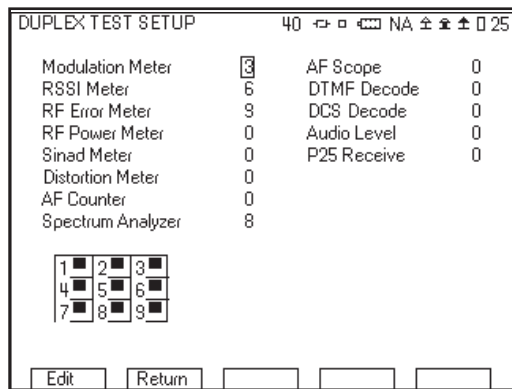

Receiver Test Screen

The Transmitter Test screen operates as a signal analyzer, measuring the parameters associated with the transmit portion of the radio being tested. Included in this screen are measurements of the modulation, the RF power, and RF frequency error.

Transmitter Test Screen

Any of the test screens can be easily configured with the meters that are needed according to the type of tests that the user wants to perform by selecting the meters from the setup screen. Users can quickly define the "look" of the instrument by configuring the way the meters are displayed on the screen.

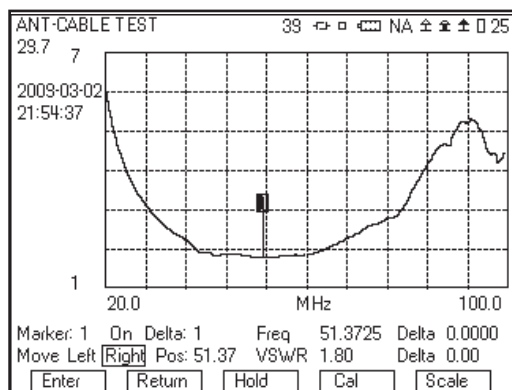

Duplex Test Setup Screen

Isolate Cable and Antenna Problems

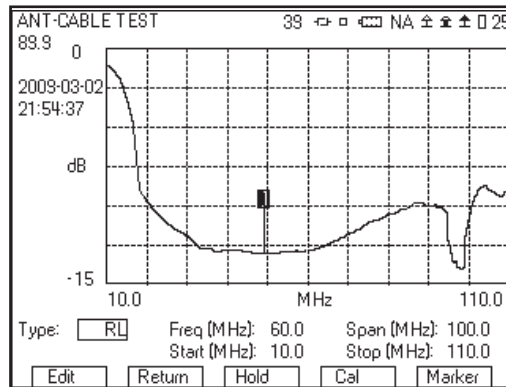

Since many radio faults lie in the cabling and/or antenna and not with the radio, the 3515A includes the capability to measure the VSWR or return loss of an antenna, and the loss or distance to fault of a cable. By isolating the problem to the cable, connector or antenna, you can avoid returning good radios to the depot or manufacturer for repair, thus avoiding radio system down time. The SWR Test screen provides the user with the option to display:

- VSWR versus frequency
- Return loss versus frequency
- Cable loss versus frequency
- Return loss versus feet

The display of VSWR or Return Loss (RL) versus frequency is useful for observing the characteristics of an antenna. The following two screenshots show examples of these two types of measurements.

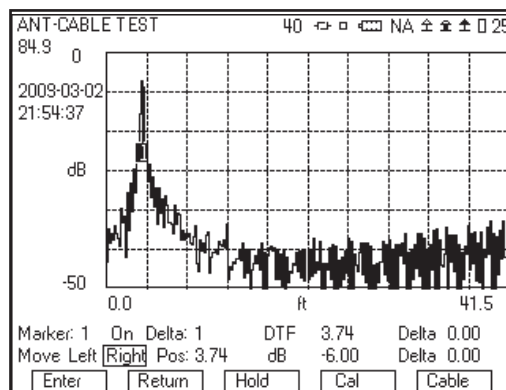

SWR Test Screen Showing VSWR Versus Frequency

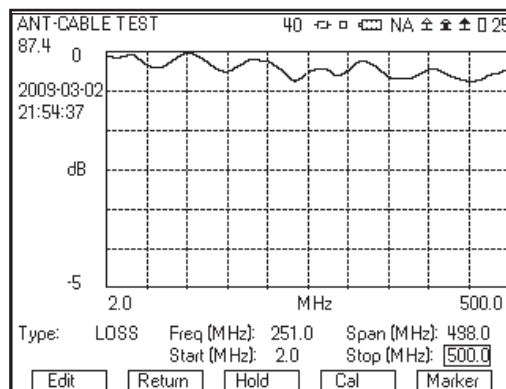

SWR Test Screen Showing RL Versus Frequency

The display of return loss versus feet is descriptive of the characteristics of a cable, illustrating to the user the precise location of faults (DTF). The following screenshot shows a display of a cable that is 3.74 feet in length.

SWR Test Screen Showing DTF

The cable loss feature enables the user to do a one port measurement of the loss of a cable over frequency. For example, the following screen shot shows the loss of a cable over the frequency range of 2 MHz to 500 MHz.

SWR Test Screen Showing LOSS

Up to three markers can be enabled for use in analyzing the graphical data that is acquired on the SWR test screen. The markers provide the user with information on the precise return loss at a given distance for DTF mode or the exact VSWR at a given frequency for SWR

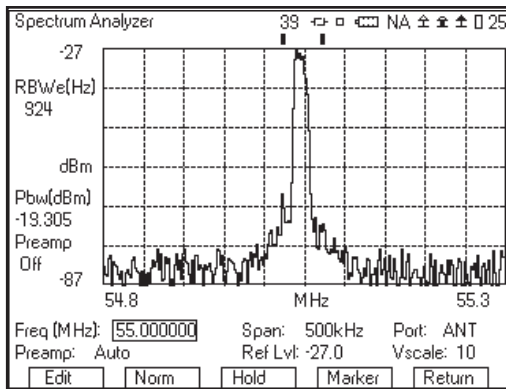

mode. A delta function, associated with the markers, is also available in order to show the difference in VSWR and frequency, or return loss and feet, between two of the markers.

Save/Recall Features

The 3515A allows users to configure the test setup and then save these setups internally for future use. This feature allows fast testing on radios that require constant testing, base station verification and for testing a large number of the same radio.

Spectrum Analyzer (35XXOPT01)

Now available as an option for 3515A is an FFT based spectrum analyzer. An FFT analyzer uses a snapshot of the incoming RF signal that is within the selected span and converts it to a frequency spectrum. The advantage of using this method is that the spectrum is converted from one set of data and not from a sweep where the RF signal may have changed from the start of the frequency sweep to the finish. The noise floor of the spectrum analyzer is < -136 dBm in the 10 kHz span. The 3515A analyzer has a span width that ranges from 10 kHz to 5 MHz with an effective resolution bandwidth as narrow as 19 Hz. A marker function includes the capability of measuring the power within a particular bandwidth and at a specified offset from the center frequency. The 3515A Spectrum Analyzer can be accessed from the Transmitter Test screen, the Duplex Test screen, and as a stand-alone spectrum analyzer.

Spectrum Analyzer

Oscilloscope (35XXOPT02)

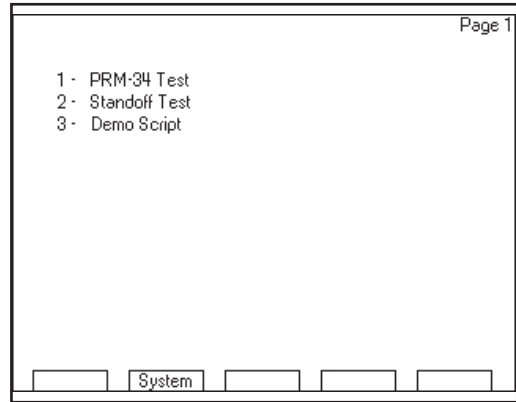

The Oscilloscope option enables the 3515A to display external audio or the demodulated audio of a received signal. The oscilloscope features 2 markers and a horizontal range of 0.5 mS/Div to 0.1 Sec/Div, sufficient for observing and analyzing audio signals.

Audio Frequency Scope

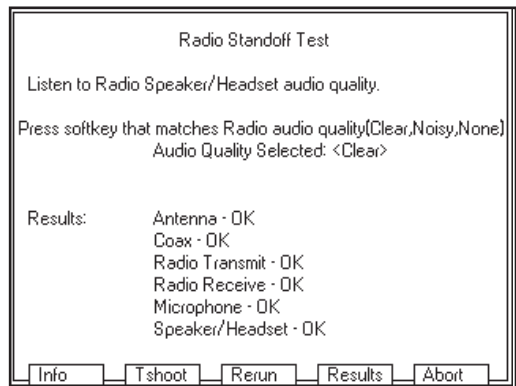

Scripting Language (35XXOPT05)

The latest option for the 3515A is the Scripting Language Option. The Scripting Language allows the user to develop and implement test procedures, including instrument settings, reading user prompts and instructions, plus collect and record data. This powerful feature reduces and helps to eliminate operator training, reduces errors and documents testing results.

Script Set-up

As shown in the screen above, a simple selection menu allows a particular script to be recalled for test. The Standoff Test screen (below) shows one example of how Scripting can be used to create a simple but effective means to isolate faulty components within a radio installation.

Standoff Test Screen

SPECIFICATION

RF SIGNAL GENERATOR

FREQUENCY

Range

2 MHz to 1 GHz

Resolution

1 Hz

Accuracy

Same as timebase

OUTPUT LEVEL

Range

T/R port: -50 to -120 dBm/707 μ V to .224 μ V
